

## Tutorial Week 3

**Definition 1.** A string is a **border** of another string, if the two are different and the former occurs both as a prefix and as a suffix for the later. For a string  $w$ , an integer  $p$  with  $0 < p \leq |w|$  is a **period** of  $w$  if  $w$  has a border of length  $|w| - p$ .

**Exercise 1.** Consider the following algorithm calculating the length of the longest borders of all prefixes of a string  $x$  of length  $m$ .

---

**Algorithm 1** Compute borders(string  $x$ ; integer  $m$ )

---

```

1:  $MP\_next[0] = -1$ 
2: for  $i = 0$  to  $m - 1$  do
3:    $j = MP\_next[i]$ .
4:   while  $j \geq 0$  and  $x[i] \neq x[j]$  do
5:      $j = MP\_next[j]$ 
6:   end while
7:    $MP\_next[i + 1] = j + 1$ 
8: end for
9: return  $MP\_next$ 

```

---

Fill up the values in the following table of borders of prefixes, for each of the strings.

strings	0	1	2	3	4	5	6	7	8	9	10
<i>ababa</i>											
<i>abcacabb</i>											
<i>abcacababc</i>											
<i>abacabacab</i>											

What is the complexity of the algorithm?

*Solution:*

strings	0	1	2	3	4	5	6	7	8	9	10
<i>ababa</i>	-1	0	0	1	2	3					
<i>abcacabb</i>	-1	0	0	0	1	0	1	2	0		
<i>abcacababc</i>	-1	0	0	0	1	0	1	2	1	2	3
<i>abacabacab</i>	-1	0	0	1	0	1	2	3	4	5	6

The algorithm has time complexity  $\mathcal{O}(m)$ . ■

**Exercise 2.** Consider the Morris-Pratt search algorithm, that finds a pattern  $x$  of length  $m$  in a text  $y$  of length  $n$ . Consider for this, the pattern  $x = aba$  and the text  $y = abcacababc$ .

---

**Algorithm 2** MP(string  $x, y$ ; integer  $m, n$ )

---

```

1:  $i = 0, j = 0$ 
2: while  $j < n$  do
3:   while ( $i == m$ ) or ( $i \geq 0$  and  $x[i] \neq y[j]$ ) do
4:      $i = MP\_next[i]$ 
5:   end while
6:    $i = i + 1$ 
7:    $j = j + 1$ 
8:   if  $i == m$  then
9:     output:  $x$  ‘occurs in’  $y$  ‘at position’  $j - i$ 
10:  end if
11: end while

```

---

a) Complete the following table concerning the Preprocessing phase.

strings	0	1	2	3
$x[i]$	<i>a</i>	<i>b</i>	<i>a</i>	
$MP\_next$				

b) Complete the following table concerning the Searching phase.

$j$	0	1	2	3	4	5	6	7	8	9	10
$i$											

- c) What is the actual value that the algorithm will return?  
d) What is the search phase complexity?

*Solution:*

a) Complete the following table concerning the Preprocessing phase.

strings	0	1	2	3
$x[i]$	$a$	$b$	$a$	
$KMP\_next$	-1	0	0	1

b) Complete the following table concerning the *Searching* phase.

$j$	0	1	2	3	4	5	6	7	8	9	10
$i$	0	1	2	0	1	0	1	0	1	2	3

c) The algorithm will return the position 7 in *abcacacabac*?

d) The *Searching* phase of the algorithm has complexity  $\mathcal{O}(n)$ . ■

**Exercise 3.** Consider the following algorithm calculating the length of the longest borders of all prefixes of a string  $x$  of length  $m$ , followed by a character different from the one following the prefix, and  $-1$  otherwise.

---

**Algorithm 3** Compute  $KMP\_next(\text{string } x; \text{integer } m)$

---

```

1:  $k = 0$ 
2:  $j = KMP\_next[0] = -1$ 
3: for  $i = 0$  to  $m - 1$  do
4:   if  $x[i] == x[k]$  then
5:      $KMP\_next[i] = KMP\_next[k]$ 
6:   else
7:      $KMP\_next[i] = k$ 
8:     do  $k = KMP\_next[k]$ 
9:     while  $k \geq 0$  and  $x[i] \neq x[k]$ 
10:  end if
11:   $k = k + 1$ 
12: end for
13:  $KMP\_next[m] = k$ 
14: return  $KMP\_next$ 

```

---

Fill up the values in the following  $KMP\_next$  table, for each string.

strings	0	1	2	3	4	5	6	7	8	9	10
<i>ababa</i>											
<i>abcacabb</i>											
<i>abcacababc</i>											
<i>abacabacab</i>											

What is the complexity of the algorithm?

*Solution:*

strings	0	1	2	3	4	5	6	7	8	9	10
<i>ababa</i>	-1	0	-1	0	-1	3					
<i>abcacabb</i>	-1	0	0	-1	1	-1	0	2	0		
<i>abcacababc</i>	-1	0	0	-1	1	-1	0	2	0	0	3
<i>abacabacab</i>	-1	0	-1	1	-1	0	-1	1	-1	0	6

The algorithm has time complexity  $\mathcal{O}(m)$ .

■
